

Grateful: Command-Line Parameters

The first actual command-line parameter contains the name of the `.grades` file (which corresponds to the eid of the student).

The second actual command-line parameter contains the number of digits to the right of the decimal place that should be used for the output of the program.

Subsequent actual command-line parameters contain the integer weights to use for the different categories of grades. So, the third actual command-line parameter contains the weight to use for the category with an ID of 1, the fourth actual command-line parameter contains the weight to use for the category with an ID of 2, etc... (Note that the weights do not need to sum to 100.)
