

The GradeWriter Application v1.0

1. `args[0]` will contain the `eid` of the relevant student.
2. The remaining command-line arguments will contain `String` representations of the individual grades (which will not contain white space for simplicity).
3. It must “parse” the `String` representations and discard any that are not formatted properly.
4. It must write a human-readable `String` representation of the `ArrayList<Grade>` of properly-formatted `Grade` objects to a file named `eid.grades`.
